Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention describes an isolated polypeptide (I) comprising a C fibroblast growth factor 23 (FGF23) polypeptide or its mutant, variant, C homologue or fragment. (I) is useful for treatment of a hypophosphatemic C disorder such as autosomal dominant hypophosphatemic rickets (ADHR), CC x-linked hypophosphatemic rickets (XIH), hereditary hypophosphatemic C rickets with hypercalciuria (HHRH), hypophosphatemic bone disease (HBD), CC epidermal nevus syndrome, fibrous dysplasia tumour induced osteomalacia CC (TIO), and nephrolithiasis. (I) can also be used in treatment of a CC hyperphosphatemic disorder such as mild renal insufficiency and tumoural CC calcinosis. Osteoporosis, conditions (e.g., dermatcomyositis) involving CC deposition of calcium and phosphate in the arteries or soft tissues of CC described in the invention. Preferably, the nucleic acid or the CC described in the invention. Preferably, the nucleic acid or the CC formation of the invention. Preferably, the nucleic acid or the CC described in the invention. Preferably to treat disease dindividuals. This sequence encodes the novel therapy to treat diseased individuals. This sequence encodes the novel comman fibroblast growth factor 23 (FGF23) studied in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                      The present invention describes DNA encoding a polypeptide having the cativities of inhibiting hypophosphataemia, phosphate transport and calcification, and regulating vitamin D metabolism in vivo. The polypeptide is of human origin (designated OST311) which is localised to chromosome 12p13, or is derived from this by addition, deletion and/or substitution of one or more amino acid residues. OST311 has osteopathic, rephrotropic, antihyperphosphataemic and cytostatic activities. The OST311 polypeptide regulates phosphorus transport and calcium metabolism. OST311 sequences can be used for the treatment and diagnosis of skeletal disorders such as bone cancer, bone formation abnormalities, vitamin D resistance, osteoporosis, Paget's disease and bone calcium deficiency, kidney disorders such as kidney function deficiency, renal phosphate calcales acidosis and Fanconi's disease. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-AUG-2000;

Novel nucleic acids encoding fibroblast growth factor-20, useful for detecting and modulating FGF-20 and for treating, e.g. cancer, neurodegenerative disorders, hepatic disorders and cardiovascular

Claim 1; Fig 9; 149pp; English.

CC Polynucleotide sequences AAC61155-C61160 encode fibroblast growth CC factor-20 (FGF-20) proteins AAY85637-Y85639. The invention includes CC FGF-20 sequences isolated from humans and monkeys. Proteins, CC polynucleotides, agonists and antagonists of the invention have CC cytostatic; nootropic; neuroprotective; antiparkinsonian; anticonvulsant CC and hepatotropic activity. The peptides, nucleotides and their binding CC agents my be used to modulate the expression or activity of FGF-20, or to CC diagnose aberrant FGF-20 expression. FGF20 activity or expression may be CC down-regulated to treat proliferative or differentiative disorders (e.g. CC cancers and leukaemia), tumour angiogenesis and metastasis, skeletal CC dysplasia, neurodegenerative disorders (e.g. Alzheimer's disease, CC Parkinson's disease, multiple sclerosis, amylotrophic lateral sclerosis, CC progressive supranuclear palsy, epilepsy or Creutzfeldt-Jakob disease), thepatic disorders, cardiovascular disorders and haematopoietic and/or myeloproliferative disorders. ő

The invention relates to full length GENSET human nucleic acids encoding CC potentially secreted proteins. The nucleic acids and the polypeptides CC they encode may be used in the prevention, treatment and diagnosis of Cd diseases associated with inappropriate GENSET gene expression. For CC example, they be used to treat disorders associated with decreased CG ENSET gene expression by rectifying mutations or deletions in a CC patient's genome that affect the activity of GENSET or by supplementing CC antisense nucleic acid molecules may be administered to down regulate CENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA probes in diagnostic assays to detect and quantitate the CC presence of similar nucleic acid sequences in samples, and hence to GENSET polypeptides may be used as antigens; and hence to CC determine which patients may be in need of restorative therapy. The GENSET polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and continued to continue the continued to the continued t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence encodes a human fibroblast growth factor (FGF)
Chomologue, designated zFGF12. The zFGF12 polypeptides contain a motif
C (see AAB84654) that occurs in all known members of the FGF family, which
is unique to these proteins. This motif is highly conserved in all
C members of the FGF family, however, zFGF12 appears to be unique in that
the conserved Glu is a His (residue 117) substituting a basic amino
c acid (aa) residue for an acidic aa residue. The zFGF12 gene is mapped
to chromosome 12, location 12q.1.3. zFGF12 may be used in the
prevention, diagnosis and treatment of diseases associated with
inappropriate FGF expression: Disorders and processes that may be
prevented, diagnosed, and treated include, for example proliferation
c inappropriate FGF expression: Disorders and processes that may be
grevented, diagnosed, and treated include, for example proliferation
c differentiation of haematopoietic cells, hyperplasia and regeneration,
differentiation flaematopoietic cells, strokes, angiogenesis and

                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a fibroblast growth factor polypeptide, CC designated zFGF12, comprising a sequence at least 95 % identical to CC residues 25 to 251 of the 251 amino acid sequence, given in the CC specification. The activity of the fibroblast growth factor of the CC invention may be described as vulnerary. zFGF12 can be used to promote CC wound healing of the epidermis, to protect and promote recovery of CC epithelial cells in the gastrointestinal tract, small intestine and oral CC mucosa after chemotherapy or radiation, and to stimulate lung epithelial CC cells after lung injury or complications in neonates following premature CC birth. The polypeptide can also be used to modulate proliferation and CC tinscue. The polypeptide is also useful to stimulate proliferation of cc cultured mesenchymal cells and to identify new family members. The CC current sequence represents the human zFGF12 encoding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FILLA

nephrotropic, antihyperphosphataemic and cytostatic activities. The OST311 polypeptide regulates phosphorus transport and calcium metabolism. OST311 sequences can be used for the treatment and diagnosis of skeletal disorders such as bone cancer, bone formation abnormalities, vitamin D resistance, osteoporosis, Paget's disease and bone calcium deficiency; kidney disorders such as kidney function deficiency, renal phosphate leakage, urinary tubule acidosis and Fanconi's disease. The present The present invention describes DNA encoding a polypeptide having the activities of inhibiting hypophosphataemia, phosphate transport and calcification, and regulating vitamin D metabolism in vivo. The polypeptide is of human origin (designated OST311) which is localised to chromosome 12p13, or is derived from this by addition, deletion and/or substitution of one or more amino acid residues. OST311 has osteopathic, sequence is used in the exemplification of the present invention. y the

                                                                        밁
                                                                                                                                               밁
                                                                                                                                                                                                                                                                                              Polymucleotide sequences AAC61155-C61160 encode fibroblast growth CC factor-20 (FGF-20) proteins AAV85637-V85639. The invention includes FGF-20 sequences isolated from humans and monkeys: Proteins, colling of the invention have polymucleotides, agonists of an antagonists of the invention have cytostatic; nootropic; neuroprotective; antiparkinsonian; anticonvulsant and hepatotropic activity. The peptides, nucleotides and their binding cagents my be used to modulate the expression or activity of FGF-20, or to diagnose aberrant FGF-20 expression. FGF20 activity or expression may be down-regulated to treat proliferative or differentiative disorders (e.g. cancers and leukaemia), tumour angiogenesis and metastasis, skeletal dysplasia, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, multiple sclerosis, amylotrophic lateral sclerosis, progressive supranuclear palsy, epilepsy or Creutzfeldt-Jakob disease), hepatic disorders, cardiovascular disorders and haematopoietic and/or myeloproliferative disorders.
                                                                                                                                                                                                                   Query Match

Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g. lung, breast, prostate, cervical

Claim 3; Fig 265; 813pp; English.

CA AAS21244-AAS21518 encode for novel human secretory and transmembrane CC PRO polypeptides. The PRO polypeptides are useful to detect other CC PRO polypeptides, to link bioactive molecules to cells expressing CC PRO polypeptides, to modulate biological activities of cells expressing CC PRO polypeptides, and to detect the presence of mammalian lung, colon, CC breast, prostate, rectal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. CC some of the 275 sequences are also useful to stimulate the release of CC tumour necrosis factor-alpha (TNF-alpha) from human blood, the CC proliferation or differentiation of chondrocytes, the proliferation or colliferation or colliferation or colliferation of inner ear utricular supporting cells or CC gene expression in pericyte cells, the release of proteoglycans from CC cartilage, the proliferation of inner ear utricular supporting cells or CC of T-lymphocytes, the release of a cytckine from peripheral blood CC monocytes (PBMCs), or the proliferation of endothelial cells. Some of CC skeletal muscle cells or by adipocytes, or inhibit binding of A-peptide CC to factor VIIA. The PRO polypeptides can be used in assays to identify CC molecules involved in binding interactions. The polynucleotides encoding CC PRO polypeptides can be used in gene therapy. NA, CC transgenic or knock out animals and can be used in gene therapy.

```
The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins C can be used for targeted delivery of bioactive molecules, such as C toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in C chromosomal and gene mapping, and in the generation of anti-sense RNA CC and DNA. They may also be used to produce transgenic animals which are CC used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in CC treating cancer. Anti-PRO antibodies can be used in diagnostic assays. CC ARF44270 to AAF4470 represent PCR primers and hybridisation probes used CC in the isolation of human PRO sequences. AAF44087 to AAF44269 and CC AAB65134 to AAB65300 represent human PRO polynucleotide and protein CC sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                      Roy MA,

CC The invention relates to secreted and membrane associated polypeptides CC and nucleic acid molecules encoding such polypeptides. Sequences of the CC invention are useful for treating diseases such as Alzheimer's disease, CC amyotrophic lateral sclerosis (ALS), Zollinger-Ellison syndrome, disease, CC amyotrophic lateral sclerosis (ALS), Zollinger-Ellison syndrome, diseases CC of the immune system, haematopoietic disease, inflammation, anxiety, CC schizophrenia, feeding disorders, anorexia, depression, social, sexual CC and rewarded behaviour, cardiovascular disease, sleep disorder, learning CC and memory alteration and altered immune response, seizure, migraine, CC cancer, stroke, asthma, neuropathy, aging, sexual disorders, treatment CC of transsexuals, growth abnormalities, obesity, infections, autoimmune CC diseases (e.g. rheumatoid arthritis), cataractogenesis, angiogenesis, CC disorders associated with healthy maintenance of gastric mucosa and crepair of acute and chronic mucosal lesion, lung carcinoma, cerebral CC ischaemia, atherosclerosis, cirrhosis, Huntington's disease, headache, CC ammesia, multiple sclerosis, Hodgson's disease, dilated cardiomyopathy, CC congestive heart failure, cardiac arrhythmias, hypercholesterolaemia, CC viral and onn-viral hepatitis, type I and type II diabetes mellitus, CC glomerulonephritis, renovascular hyperthermia. Polypeptides of the CC invention are used to identify membrane bound and soluble receptors. CC paralyses, tendinitis and malignant hyperthermia. Polypeptides of the CC invention as vaccines for inducing an immunological response ci na mammal. Polynucleotides of the invention are used in gene therapy. CC may are also valuable for chromosome localisation studies and tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence encodes fibroblast growth factor 23 (FGF-23). CC Human FGF-23 polynucleotides and polypeptides are useful for treating a patient suffering from traumatic injury or a condition characterized by dysfunction of or injury to skin cells, a condition characterized by inadequate function of placental cells (e.g. congenital defects, condequate function of placental cells (e.g. congenital defects, condequate function of placental cells (e.g. congenital defects, condequate function of the thymus (e.g. leukemia, lymphoma, autoimmune disease, condition of the thymus, or differentiation disorder of the thymus), or a condition characterized by central nervous system condition characterized by caseful in the treatment of Crohn's disease, healing of intestinal wounds buckers, inflammation, conjuries and surgical anastemoses, motility and absorption disorders, and congenital malformations of the intestine. They are also useful for treating ischemic vascular diseases (e.g. myocardial ischemia/infarction, conjuries and surgical anastemoses, motility and absorption disorders, and congenital malformations of the intestine. They are also useful for conjunction ischemic vascular diseases (e.g. myocardial ischemia/infarction, conjunction or death of skeletal muscle cells, bone cells or supporting cells (e.g. skeletal myopathies, bone disease, or arthritis).

DR P-PSDB; AAG63947.

XX Isolated nucleic acids encoding the human and murine fibroblast growth pr factor 23, useful in the treatment of a condition characterized by rinadequate function of placental cells (e.g. congenital defects) and the thymus (e.g. leukemia) -

XX Claim 2; Fig 3; 77pp; English.

XX Claim 2; Fig 3; 77pp; English.

XX Crime present sequence encodes fibroblast growth factor 23 (FGF-23).

CC The human FGF-23 polynucleotide and polypeptide are useful for treating comparison of or injury to skin cells, a condition characterized by inadequate function of placental cells (e.g. congenital defects, fettility, or abnormal growth); a condition characterized by inadequate function of placental cells (e.g. congenital defects, fettility, or abnormal growth); a condition characterized by inadequate function of placental cells (e.g. congenital defects, fettility, or abnormal growth); a condition characterized by inadequate function of placental cells (e.g. congenital defects, fettility, or abnormal growth); a condition characterized by central nervous system condition characterized by central nervous system conditions, or a condition characterized by central nervous system conditions, and congenital malformations of the human condition characterized by central nervous system configuration of crohm's disease or Alzheimer's disease. The human configuration disorders, and congenital malformations of the intestine. They are also useful for treating ischemic vascular disease, renal congenital malformations of the intestine. They are also useful for treating ischemic vascular disease, renal congenital malformations of the intestine. They are also useful for treating ischemic vascular disease, renal congenital malformation of skeletal muscle cells, bone cells or supporting cells (e.g. skeletal myopathies, bone disease, con arthritis).

XX Sequence 756 BP; 159 A; 250 C; 212 G; 135 T; 0 other;

                                                                                                                                                                                The invention relates to a DNA (ABN81575) encoding a protein (ABB77581) PGF23 and mutants FGF23 comprising an amino-acid substitution of argining at position 176 to glutamine and/or position 179 to glutamine or tryptophan. The mutants are generated by introducing the following base changes in the nucleic acid sequence: R1760 mutant is generated by G527A; R179Q is generated by G535A; and R179W is generated by C535T. The protein and encoding DNA are applicable in remedies for hyperphosphataemia, including gene therapy.

```
The invention relates to a method for inhibiting expression of a target Gene (ABL91658-ABL91797) in a cell by introducing at least one coligoribonucleotide that has a double-stranded structure consisting of at CC most 49 sequential nucleotide pairs, with at least part of one strand CC complementary with the target gene and has at least one end a CC single-stranded segment of 1-4 nt. The method provides CC cligoribonucleotides for antisense inhibition of gene expression useful CC e.g. for treating tumours but the oligoribonucleotides may also be CC directed against genes present in pathogens (e.g. Plasmodium or CC viruses/viroids, pathogenic on humans, animals or plants) or against CC viruses/viroids, pathogenic on humans, animals or plants) or against CC viruses/viroids, pathogenic on humans. The method provides more CC effective inhibition of gene expression than use of known coligonucleotides, probably because the unpaired overhang increases contained the simple content of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match 46.9%; Sc

                                                                                                                                                                                                                                                                                      75
                                                                                                                                                                                                                                                                           fractionation. Libraries were amplified once on solid support and plasmid DNA from each library was prepared and mixed in equal amounts. The mixed library DNA was normalized by method #4 from Bonaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded mixed library plasmid DNA was mixed with 5 micrograms PCR product representing mixed library inserts and hybridized to an Ecot of 6. Single-stranded (unhybridized) plasmids were isolated by hydroxyapatite chromatography and used to make this library."
